

Train Dispatcher Software Error or Safety Issue Reporting Tool

This tool is designed as a way to report errors and glitches that could present safety vulnerabilities within Train Dispatch systems. Furthermore, the Reporting Tool has been designed as a means of reporting other safety issues that Dispatchers encounter within their daily work.

Examples of these include (but are not limited to) a Dispatcher console screen where a crossing protection displays in the wrong track segment, new Carrier software that is not reliably protecting as claimed, or radio "dead spots" where Dispatchers regularly have no communication with trains.

If you choose to submit a report, please make sure to include all relevant information.
